## DESCH Pex Couplings

PX 12 - GB

POWER TRANSMISSION

# Flexible DESCH Pex Couplings

The flexible DESCH Pex couplings are claw couplings with flexible elements to provide a torsionally flexible connection for shafts. The flexible elements excel in their wear resistance, ageing resistance and their temperature resistance from  $-30^{\circ}\text{C}$  to  $+80^{\circ}\text{C}$ . Thanks to their flexibility, impacts, rotary vibrations and noises are effectively absorbed. The flexible elements are dimensioned such that radial, axial and angular movements between the two halves of the coupling are cancelled out. The flexible DESCH Pex couplings are of the plug-in type for installation and do not involve any particularly rigorous requirements with respect to alignment accuracy. The balancing quality is, in accordance with DIN-ISO 1940, in the quality range G 16. DESCH Pex couplings can be used in the whole of machine construction wherever a reliable shaft connection is needed between motor and machine.

## Type B

The DESCH Pex type B coupling is fail-safe up to the fracture moment of the cast iron transmission cam and this provides maximum operational safety. The flexible elements can be supplied with hardness 80° shore A. With the fixed position of the flexible elements its deformability in axial direction is free, and so no damaging axial forces can act on the machine bearing even with alternating torque.

## Selection

The torque of the machine TAN is determined by:

$$T_{\text{AN}} [\text{Nm}] = 9550 \times \frac{P_{\text{Motor}} [\text{kW}]}{n [\text{rpm}]}$$

This torque  $T_{\text{AN}}$  multiplied by a safety factor „S“ depending on the application and the temperature factor  $S_T$  (see table page 5) gives the required nominal coupling torque  $T_{\text{KN}}$ .

result:  $T_{\text{KN}} \geq S \times S_T \times T_{\text{AN}}$

## Wear indicator for DESCH Pex

The wear indicator for DESCH Pex couplings enables the condition of the flexible to be easily assessed. The wear condition can also be ascertained with the aid

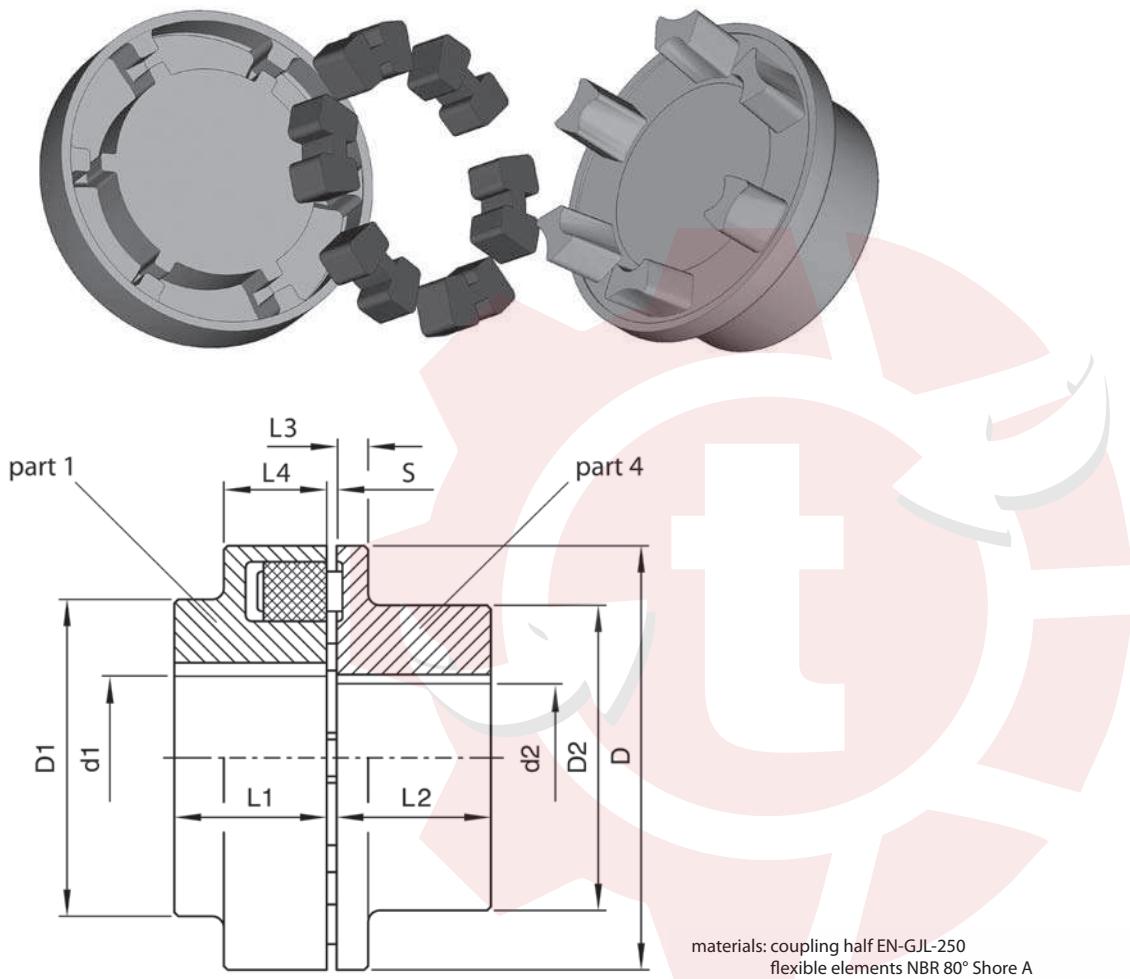

of a stroboscope while the coupling is rotating.

The production process can thus continue undisturbed.

The wear indicator must be attached to the outside diameter of the coupling after the coupling has been fitted.

1) The information concerning weights and moments of mass inertia apply for medium holes.

2) The values mentioned are valid for 1500 rpm and may occur only separately. At multiple misalignments or higher speeds the values must be reduced.
